

Building Together

Taskpoint helps teams work together to co-ordinate and manage their roles. With Taskpoint, all information is kept together in one easy to use system. Drawings, letters, email, instructions, faxes, are kept securely and can be retrieved at any time, even long after the project is completed.

Taskpoint

A fresh approach to construction management software

BUILDING TOWARD THE FUTURE

Future Projects

As your projects grow so does Taskpoint. The Taskpoint application framework is scalable to cope with the demands of changing projects, staff, and sub-contractors. New projects can be rapidly brought into Taskpoint, and the system can grow with your projects. As projects are completed they can easily be moved into archived mode where only limited staff or project administrators have access.

Taskpoint provides a permanent audit trail of instruction assignments, milestones, and even user access to the system. So information is always immediately at hand in the event of a dispute or for auditing purposes. And Taskpoint can be integrated into your existing information systems, such as general ledger, database, or financials.

A fresh new way to combine document management and project collaboration for construction, engineering and facilities management projects.

Taskpoint is highly scalable and can be deployed to address the requirements for a range of project sizes.

The Taskpoint software system combines document management and project collaboration for construction, facilities management, and engineering projects. Taskpoint is faster and more cost effective than other systems, which makes it viable for projects from the smallest task to complex projects.

CREATIVE CONSTRUCTION

Taskpoint can handle almost anything, documents, drawings, photographs, even video clips. Attach a photo or drawing to an instruction to make your point clearer.

New Construction Projects

One of the major challenges in construction and engineering projects is ensuring good and timely communication between all parties. By establishing Taskpoint as the management system early in the project, all of the team members can be kept up to date from day one. With Taskpoint all information regarding a project is kept together in one easy to use system. Taskpoint is easy to learn and understand so new users can be productive very quickly.

What about after the project is finished?

You still have a legal requirement to maintain records and instructions issued to third parties. All of the documents and instructions, in fact everything that was issued during the project, is kept securely as an archive in Taskpoint and can be retrieved long after the project is finished.

Building On Trust

Taskpoint is built on the foundations of Docpoint, document management system. Docpoint is widely known for its simplicity and reliability, and has been helping companies manage their document problems for many years. Taskpoint continues that philosophy by keeping things clear and easy to use. Just some of the features of Taskpoint include, management of documentation, engineering drawings, even accounts payable and timesheets.

Taskpoint manages communication between contractors, clients, project managers, and architects using industry standard Request for Information, Architects Instructions, Clients Instructions etc. Contractors and anyone requiring access to documentation are kept up to date by document transmittals, so the latest copies are always available. The document library maintains full version control of previous versions of all documents. The Taskpoint authentication framework ensures that only authorised users may see documents or instructions that are assigned to them.

KEEPING YOUR PROJECT ON TRACK

Logistical Challenges

These days projects can be spread all over the globe, so they present unique management challenges. High speed networks and traditional technologies

help reduce the gaps, but don't eliminate the challenges of dealing with different time zones, and

contractors on the other side of the world. Taskpoint's web based approach means users can access the system from wherever they are, whenever they wish, and does not require contractors to install any special software or undertake specialised training.

- Design & Planning
- Surveying & Logistics
- General Construction

Constructive Solutions

Taskpoint was built in Australia in consultation with real world construction managers and engineers. The system uses terms and methodologies that construction people understand, so users can be productive from day one. Along the way we recognised that not all contractors are tech savvy and many resist the need to be logging into a project management system to keep up to date. Taskpoint uses a 'push' approach that means users are notified whenever there is a new instruction or transmittal. Often this means the contractor does not need to visit Taskpoint at all. The construction manager can be confident that the right information is getting out there for all members of the project team.

Taskpoint

CASE STUDIES

A major Australian construction company wanted software to manage all of their projects, but found other products too complex and too expensive. Taskpoint fitted the bill as an easy, cost effective solution that can be used for all projects.
